

WHAT IS CLAIMED IS:

1. An IC card issuance system that issues an IC card by writing issuance data containing identification information specific to the IC card into a memory of the IC card having at least the memory incorporated therein, comprising:

an issuance file which stores each item of issuance data during issuance of the each issued IC card;

an identification information readout command storage section which stores a readout command for reading out said identification information from an issued IC card;

an identification information readout section which reads out said identification information from an issued first IC card by using said identification information readout command storage section;

an issuance data extracting section which extracts from said issuance file issuance data that corresponds to the identification information read out by the identification information readout section; and

a card issuance section which issues a new second IC card identical to said issued first IC card by writing the issuance data extracted by said issuance data extracting section into a memory of an unissued IC card.

2. A system according to claim 1, further

10015557-12301

comprising a reissuing file which stores the issuance
data extracted by said issuance data extracting
section, said issuance section issuing said second IC
card by using the issuance data stored in said
5 reissuing file.

3. A system according to claim 1, wherein said
issuance data includes card type information indicating
type of each IC card, and said identification
information readout command storage section is provided
10 in plurality according to said card type, said system
further comprising:

a card type readout command storage section which
stores a readout command for reading out said type
information from an issued IC card;

15 a correlation table which stores a correlation
between said card type information and said
identification information readout command storage
sections;

a card type readout section which reads out said
20 card type information from an issued first IC card by
using said card type readout command storage section;
and

an identification information readout command
selecting section which selects said identification
25 information readout command storage section that
corresponds to the card type information read out by
the card type readout section by referring to said

correlation table.

4. A system according to claim 1, wherein said issuance data includes an issuance flag indicating whether or not a corresponding IC card has been issued, said system further comprising:

a flag rewriting section which rewrites into "unissued" said issuance flag in issuance data that corresponds to the identification information read out by said identification information readout section; and
an issuance instructing section which instructs issuance of the IC card to said issuance section in the case where an issuance flag of the issuance data extracted by said issuance data extracting section indicates "unissued".

5. An IC card issuance system that issues an IC card by writing issuance data containing identification information specific to the IC card into a memory of the IC card having at least the memory incorporated therein, comprising a first issuance system and a second issuance system connected to the first issuance system via a communication line, wherein said first issuance system comprises:

an issuance file which stores each item of issuance data during issuance of the each issued IC card;

an identification information readout command storage section which stores a readout command for

reading out said identification information from an
issued IC card;

an identification information readout section
which reads out said identification information from
5 an issued first IC card by using said identification
information readout command storage section;

an issuance data extracting section which extracts
from said issuance file issuance data that corresponds
to the identification information read out by the
10 identification information readout section; and

a first card issuance section which issues a new
second IC card identical to said issued first IC card
by writing the issuance data extracted by said issuance
data extracting section into a memory of an unissued IC
15 card, and said second issuance system comprises:

a second identification information readout
command storage section which stores a readout command
for reading out said identification information from an
issued IC card;

20 a second identification information readout
section which reads out said identification information
from an issued first IC card by using said second
identification information readout command storage
section;

25 an identification information transmission section
which transmits said identification information read
out by said second identification information readout

1004567-12301

section to said first issuance system via said communication line;

an issuance data receiving section which receives issuance data that corresponds to said transmitted
5 identification information from said first issuance system; and

a second card issuance section which issues a new second IC card identical to said issued first IC card by writing the issuance data received by said issuance
10 data receiving section into a memory of an unissued IC card.

6. A system according to claim 5, wherein said issuance data includes issuance count information indicating the count when the corresponding IC card has
15 been issued, said first issuance system further comprising an issuance count update section which updates issuance count information that corresponds to said identification information transmitted from said second issuance system, and which transmits said
20 issuance data to said second issuance system.

7. A system according to claim 5, wherein said second issuance system comprises a reissuing file which stores the issuance data received by said issuance data receiving section, said second issuance section issuing
25 said second IC card by using the issuance data stored in said reissuing file.

8. A system according to claim 5, wherein said

issuance data includes card type information indicating type of each IC card, and said identification information readout command storage section is provided in plurality according to said card type, and said
5 second system further comprising:

a card type readout command storage section which stores a readout command for reading out said type information from an issued IC card;

10 a correlation table which stores a correlation between said card type information and said identification information readout command storage sections;

15 a card type readout section which reads out said card type information from an issued first IC card by using said card type readout command storage section; and

20 an identification information readout command selecting section which selects said identification information readout command storage section that corresponds to the card type information read out by the card type readout section by referring to said correlation table.

25 9. A system according to claim 5, further comprising a design selecting section which selects a print image design of a newly issued IC card from a plurality of print image designs different from each other, said card issuance section issuing an IC card

10015637 424704

having the print image design selected by said design selecting section.

10. A system according to claim 5, wherein said second issuance system comprises a type selecting
5 section which selects a type of a newly issued IC card from at least two types, said card issuance section issuing an IC card of the type selected by said type selecting section.

11. A system according to claim 5, wherein said
10 second issuance system comprises a card milling section which discards said issued first IC card when issuance of a second IC card by said second card issuance section is terminated.

12. A system according to claim 5, wherein said
15 second issuance system comprises an issuance count notification section which notifies the IC card's user of said issuance count.

13. An IC card issuance method that issues an IC
20 card by writing issuance data containing identification information specific to the IC card into a memory of the IC card having at least the memory incorporated therein, comprising:

reading out said identification information from
an issued first IC card by using said identification
25 information readout command data;

extracting the issuance data that corresponds to
said read out identification information from an

40045657-42404

issuance file which stores each item of issuance data during issuance of the each issued IC card; and

issuing a new second IC card identical to said issued first IC card by writing said extracted issuance data into a memory of an unissued IC card.

14. A method according to claim 13, further comprising the step of storing said extracted issuance data as a reissuing file, said issuance step including the step of issuing said second IC card by using the issuance data stored in said reissuing file.

15. A method according to claim 13, wherein said issuance data includes card type information indicating type of each IC card, and said identification information readout command data is provided in plurality according to said card type, said method further comprising the steps of:

reading out said card type information from an issued first IC card; and

selecting said identification information readout command data that corresponds to said read out card type information by referring to a correlation table which stores a correlation between said card type information and said plurality of identification information readout command data.

16. A method according to claim 13, wherein said issuance data includes an issuance flag indicating whether or not a corresponding IC card has been issued,

said method further comprising the step of rewriting
into "unissued" said issuance flag in issuance data
that corresponds to said read out identification
information, said issuance step including the step of
5 issuing the IC card in the case where an issuance flag
of said extracted issuance data indicates "unissued".
